Valagro India Conference, Hyderabad:  
For Future Farming, 26-27 May 2018

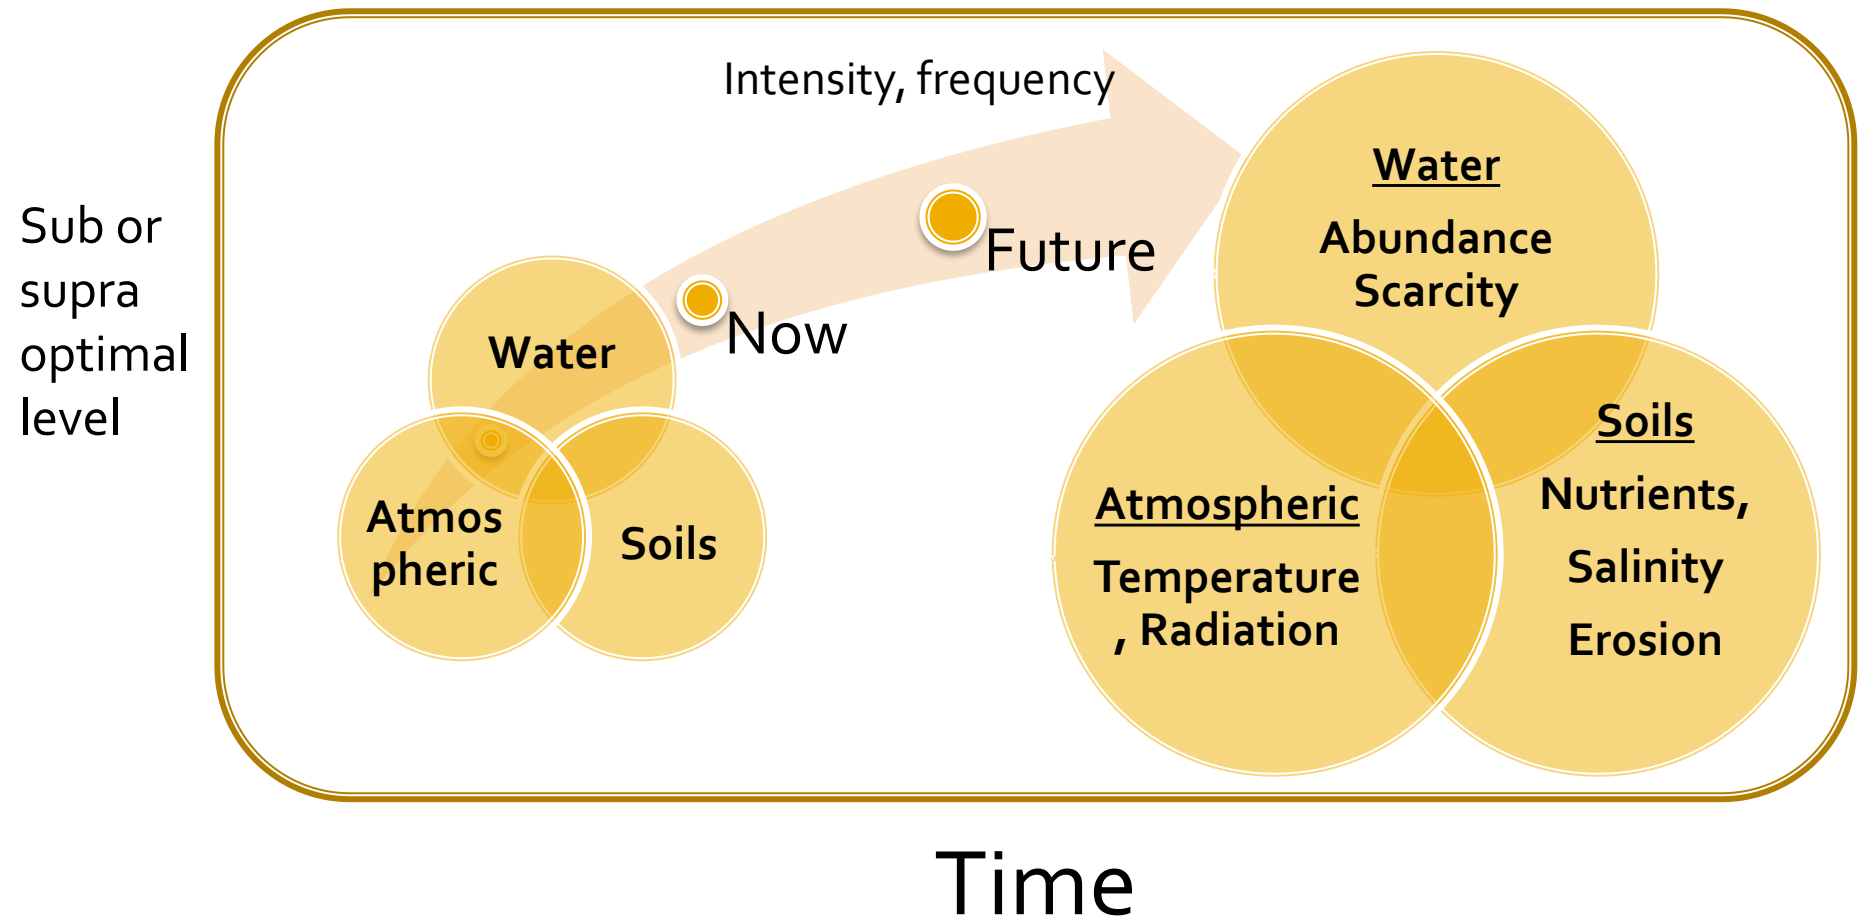

**ICAR-National Institute of Abiotic Stress Management**

# Outline

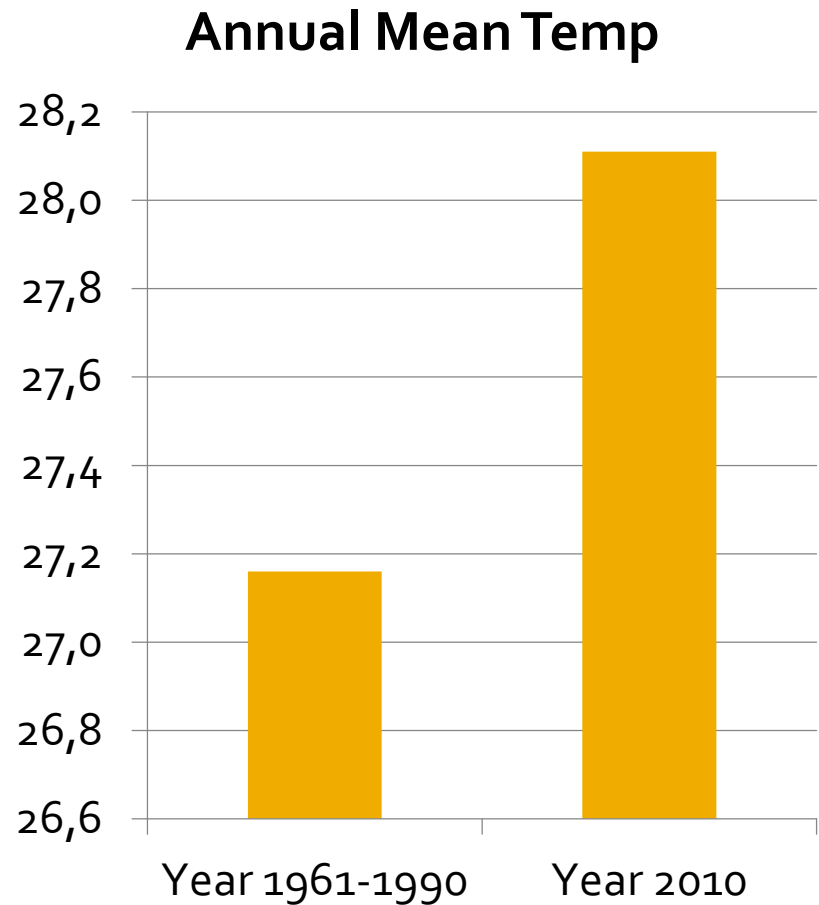

- Temperature and drought trends
- Vulnerability of commercial crops
- Physiological response
- Management options
- NIASM in action
- Summary
- Acknowledgement

# Climate change for crops implies Deviation from optimum agronomic conditions

# High temperature threat: Facts and Predictions

- **Fact:**
  - 2010, warmest year on record since 1901.
  - Eight out of ten years of the last decade were warmer.
- **Predicted increase minimum and maximum temperature Rabi season in south Asia**
- **by 2020**
  - $-1.08^{\circ}\text{C}$  and  $1.54^{\circ}\text{C}$
- **by 2050**
  - $2.54^{\circ}\text{C}$  and  $3.18^{\circ}$
- **by 2080**
  - $4.14^{\circ}\text{C}$  and  $6.31^{\circ}\text{C}$ 
    - (Lal *et al.* 2001).

# Rabi season (October –April) becoming more hotter in India

# Cooler month(December) warming more rapidly in India

Rane et al (unpublished)

# Water Stress: A glimpse at drought during 140 years

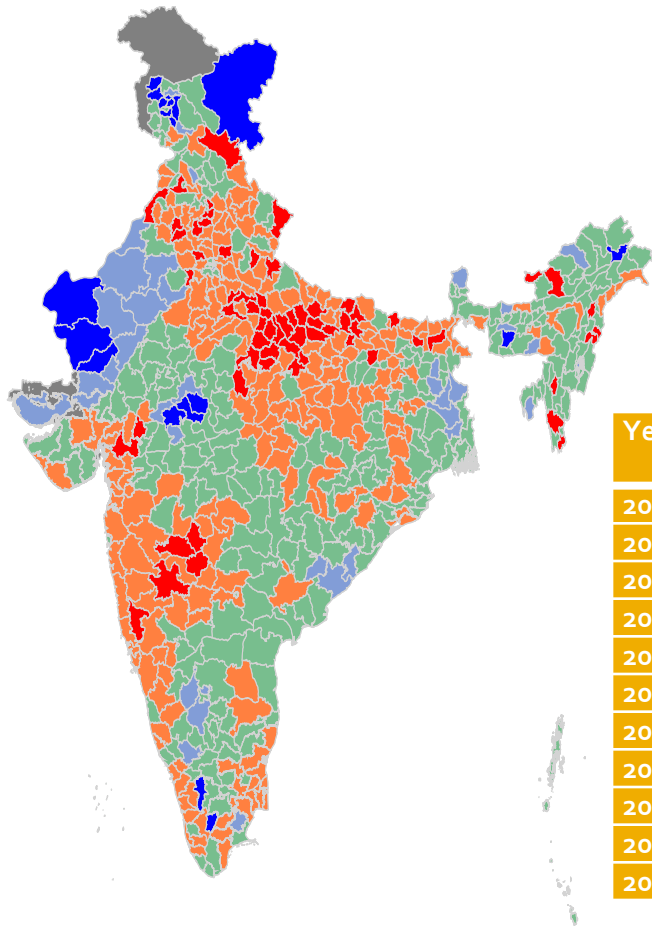

## All-India Summer Monsoon Rainfall, 1871-2016

(Based on IITM Homogeneous Indian Monthly Rainfall Data Set)

More  
drought  
during  
recent  
decades

# Impact of recent drought (2016)

Deaths due to heat wave  
in India from 2005-15

Year	No. of deaths
2005	277
2006	100
2007	416
2008	237
2009	353
2010	264
2011	Nil
2012	800
2013	1393
2014	535
2015	2500

According to the GoI response filed in the Supreme Court on 19<sup>th</sup> April 2016, at least 33 Crore (**330 million**) people from 255,923 villages across **254 districts** (out of the total 688) in **10 states** (out of the total 29) are affected by drought in 2016. - **That's more than a quarter of the population of India!**

Slide from UNICEF presentation

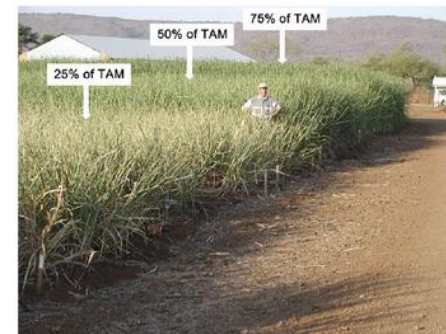

# Effect of High Temperature on Crops

- **Indirect**
  - Increase in water loss
    - evaporation -soil
    - transpiration -plant
  - Desiccation in absence of soil moisture
- **Direct**
  - Flowering and fruiting severely affected
  - Pollen, pollination and fertilization affected
  - Enzyme activities are affected

**1 °C degree rise in temperature may increase water demand by more than 10%**

# Effect of HT and Drought on Sugarcane

- Drastic reduction in production during drought years
  - Eg Maharashtra state
- Water guzzling plant has to depend on drips in future
  - Maharashtra sugarcane growers implementing
- Impact on plant
  - Leaf and plant size
  - Leaf senescence
  - Effect on physiological processes including photosynthesis

[Lopez et al.\(2011\)Experimental Botany 62\(9\):3135-53](#)

# Effect of Drought on Sugarcane

- Data reveal drastic reduction in production during drought years
  - Eg Maharashtra state

- production (lakh tones)
  - 2016-17 drought -372.45
  - 2014-15 normal -929.00
  - 2015-16 normal- 741.68
  - 2004-05 drought 204.00
- Productivity (tones/ha)
  - 2016-17 drought - 65
  - 2014-15 normal - 88
  - 2015-16 normal - 89
  - 2004-05 drought - 63
- (unpublished)

[Lopez et al.\(2011\)Experimental Botany](#) 62(9):3135-53

# Cotton: Grown by farmers even at the risk of drought in India

- out of the 14 Kharif crops
  - (paddy, maize, jowar, bajra, ragi, tur, moong, urad, groundnut, soyabean, sunflower, sesame, nigerseed and cotton)
- cotton has the maximum absolute profit  
(‘Price policy for Kharif crops -2014’ )

# Cotton: Grown by farmers even at the risk of drought in India

- About 65% of the cotton growing area
  - rainfed
  - low productivity
  - high year-to-year variations coupled with risk induced low input usage.
- If monsoon fails
  - Resowing
  - Enhance cost of cultivation
- Technologies emerging
  - Preplanted in poly- bags
  - Drip irrigation??

Making the plant survive is challenge

<https://www.gettyimages.in/detail/news-photo/july-25-wharton-county-texas-usa-cotton-plants-killed-by-news-photo/51059905#/july-25-wharton-county-texas-usa-cotton-plants-killed-by-the-worst-picture-id51059905>

# Effect of high temperature and drought on -Coffee

- High temperature
  - Optimum temperature 18-21°C
  - >23°C- rapid growth and ripening –poor quality
  - >30°C- abnormal growth, leaf yellowing, flower abortion
- Dry spells
  - Early senescence of lower leaves
  - Early flowering and reduced yield
- Common impact
  - Oxidative stress

Only 70% of normal rainfall -25 % reduction in production in the 2016/17 crop year, the lowest since 1998/99 (predicted)

Braz. J. Plant Physiol., 18(1):55-81, 2006

# Water essential for nutrient uptake

## Macronutrient deficiencies in grape

**P-deficiency**

**K-deficiency**

**Mg deficiency**

**Black leaf: Excess Na & Low K**

# Physiological disorders in grapes

**Hen & chicken**

**Shot berries**

# Physiological disorders

**Chloride toxicity**

**Berry cracking**

**Bunch stem necrosis**

# Physiological disorders due to high temperature

**Sun burn**

# Effect of water deficit and high temperature on Pomegranate

## ■ Effects

- Fruit cracking
- Sun scald/ sunburn
- Blackening of arils

## ■ Causes

- improper irrigation,
- environmental factors
- boron deficiency.
- Deficiency of calcium and potash

More in Rajasthan & some part of Maharashtra.

## ■ Fruit cracking

- 63% - spring crop (January-June),
  - 34% -the winter crop (Oct-March)
  - 9.5% -rainy season crop (July-Dec).
- Pant (1976) and Sonawane et al. (1994)

# External application of bioregulators and nutrient- as a solution

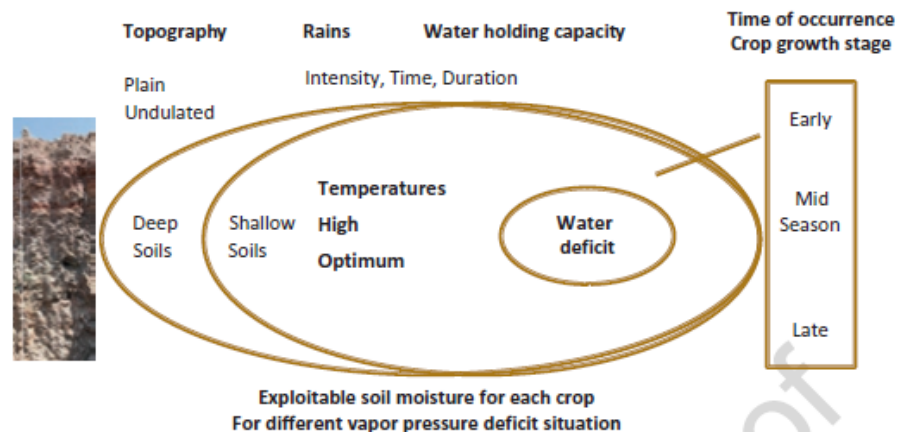

Fruit cracking

- Fruit cracking can be reduced by
  - Micronutrients
  - Growth regulators (Khatri et al. 2001)
  - Boron at 0.2% (Singh et al. 2003)
  - Pinolene (an anti transpirant) at 5% (Bacha and Ibrahim 1979)
- Regular irrigation & Use of mulch .

# Drought stress :

## Key points for climate smart agriculture

- Long dry spells
- Less rainy days
- Intermittent drought
- Early drought
- Terminal Drought

### Management Options

#### Smart management??

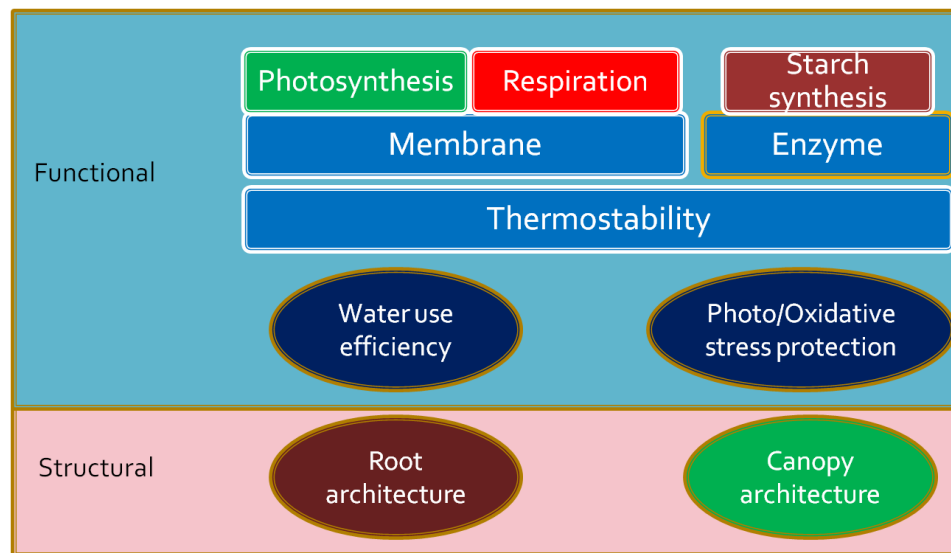

#### Smart Plants??

Rane and Minhas(2017)

# Climate smart crop-need of the hour

- Understand the physiology
  - To manage the crop
  - To improve inherent tolerance

# How plant respond to drought situation

- Plant sense drought at least in two ways
  - A. The difference in moisture content in air and the plant leaf (Vapour Pressure Deficit)
  - B. The dryness of soil

# How plant respond to drought situation

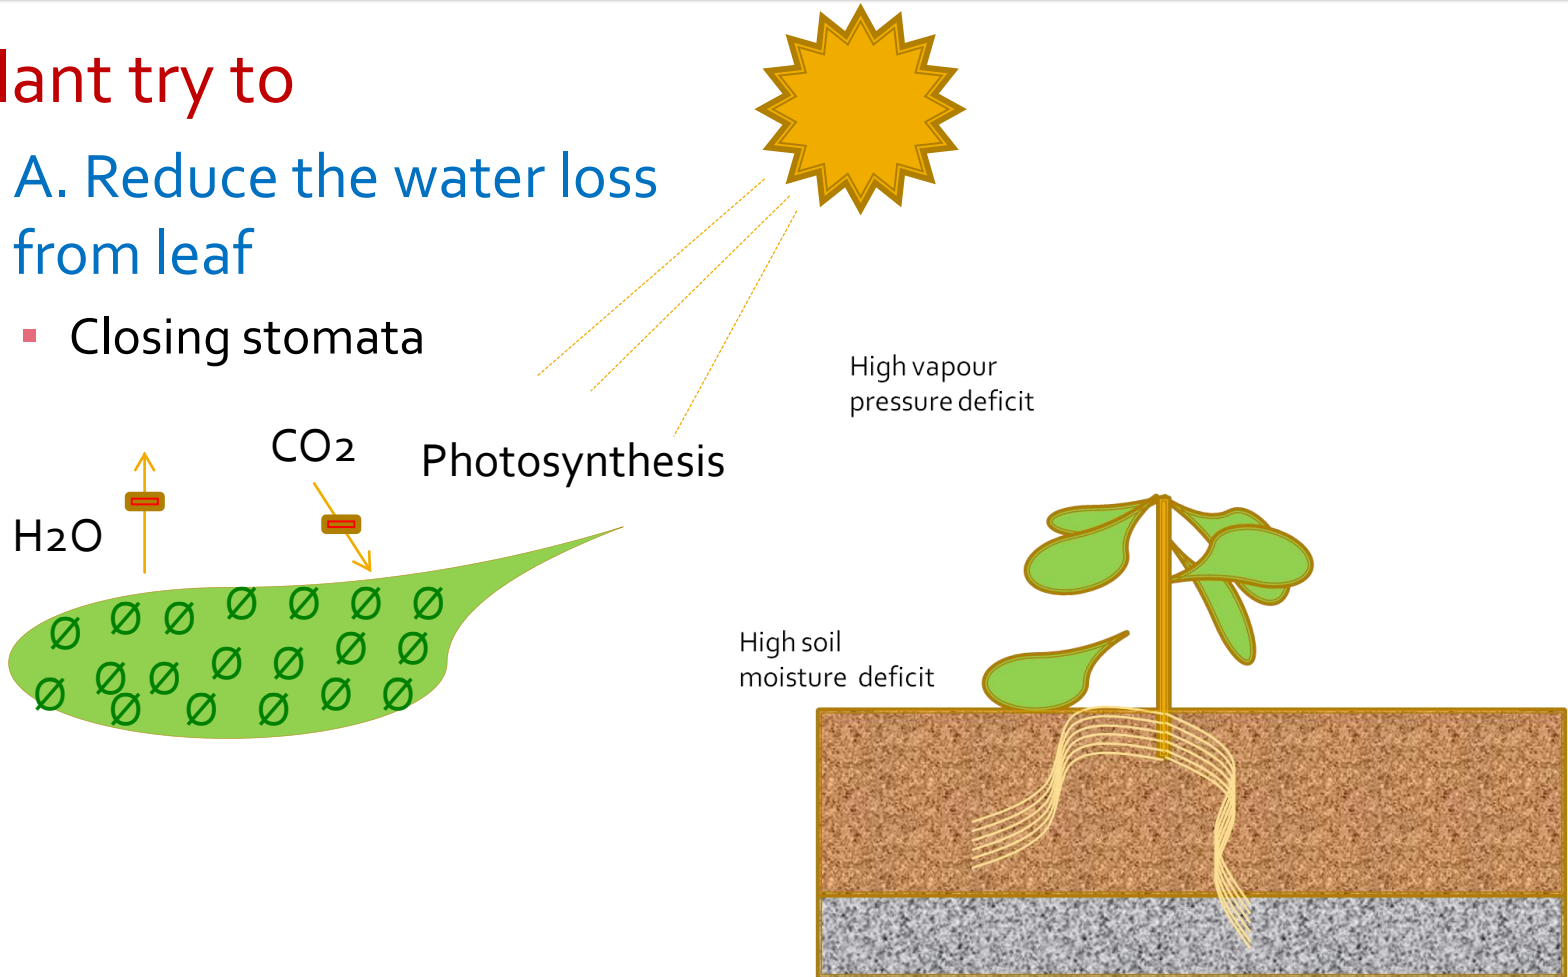

- Plant try to
  - A. Reduce the water loss from leaf
    - Closing stomata
    - Leaf drooping
    - Leaf folding
    - Leaf shedding
  - B. Start growing more roots to extract soil water
    - Deeper root
    - More branches

# How plant respond to drought situation

- Plant try to
  - A. Reduce the water loss from leaf
    - Closing stomata

# How plant respond to drought situation

- Plant try to
  - A. Reduce the water loss from leaf
    - Closing stomata

# How plant respond to drought situation

- Plant try to

- A. Reduce the water loss from leaf

- Closing stomata

# Water saving irrigation

**Full irrigation (FI):** to obtain optimal soil water dynamics, always below FC

**RDI - 50-70% water of full irrigation** to apply to the whole root system

**PRD - one side of the row should be irrigated** while the other kept dry. Shifting usually done when soil water content in dry side is reduced for 30% comparing to the wet side (after 5-10 days). PRD plants should received 50-70% of full irrigation.

# Managing available water for irrigation

Biochemicals produced in roots act as signal for closing stomata and saving water

Full Irrigation (FI)

Deficit Irrigation (DI)

PRD

20 to 40% water saving without yield loss depending on crop and soil type

# Managing available water for irrigation

Full Irrigation (FI)

Deficit Irrigation (DI)

PRD

Stomata Close

Less Water loss

ABA

# Imaging Technologies to monitor plant responses to drought and HT

## ■ Off-the-shelf technology

- Colour images
  - Plant area, volume, mass, structure, phenology, ontology
  - Senescence, chlorophyll content
  - Seed yield, agronomic traits
- Near IR imaging
  - Tissue water content
  - Soil water content
  - Grain quality
  - Stem carbohydrates
- Far IR imaging
  - Surface temperature
- Fluorescence imaging
  - Physiological state of photosynthetic machinery

## ■ Future technologies

- X-ray images of roots in soil
- High resolution NMR-based imaging of roots in soil
- Terahertz imaging of water content
- New software for new data mining
- Second generation phenomic measurements

(Adopted from from Mark Tester: Australian Plant Phenomics)

# Advances in instrumentation facilitate access to non invasive phenotyping

LemnaTec, Germany  
Crop Design

Plant MRI

Research Centre Julich, Germany  
ICAR-National Institute of Abiotic Stress Management

# Imaging accelerates characterization of plant responses

## Identifying cool genotypes out of 500 lines in 30 minutes

Rane et al (2010); CIAT Phenotyping  
Crop Science, Intl. Congress, LA, USA, Nov, 2010

# Surge in power of science

**ICAR-National Institute of Abiotic Stress Management**

# Understanding shoot response to environmental factors

## 3d shoot traits in *Arabidopsis*

### Structured / Coded Light approach

#### shoot trait analysis

- total leaf area (projected / 3d)
- leaf count
- convex hull
- compactness
- mass distribution
- leaf angle distribution

#### leaf-specific trait analysis

- single leaf area (projected / 3d)
- single leaf angle
- leaf length / width
- leaf curvature

# IoT and M2M to handle big data

## University of Tokyo, Japan

- Site specific data
  - soil moisture, temperature and radiation
- Remote sensing data
  - by UAV and satellite
  - integration as a big-data on cloud services.
- Big-data for relationship among genome and phenome.
  - Field Phenomics and smart farming -complementary.

# Imaging tools for understanding plant root dynamics

Dynamic/Functional phenotypes

Dynamic, high throughput phenotyping of drought recovery (roots, shoots and soil water uptake)

t = 0    t = 3.5 hrs    t = 7.5 hrs

Genotype 1

Genotype 2

Genotype 1 draws water faster from soil into roots and shoots

Plant water uptake

Recent technological advances for field

Portable root crown phenotyper

- Portable box with optimised light
- Rotation with motor, and video images
- New software
- Multi species including Cassava

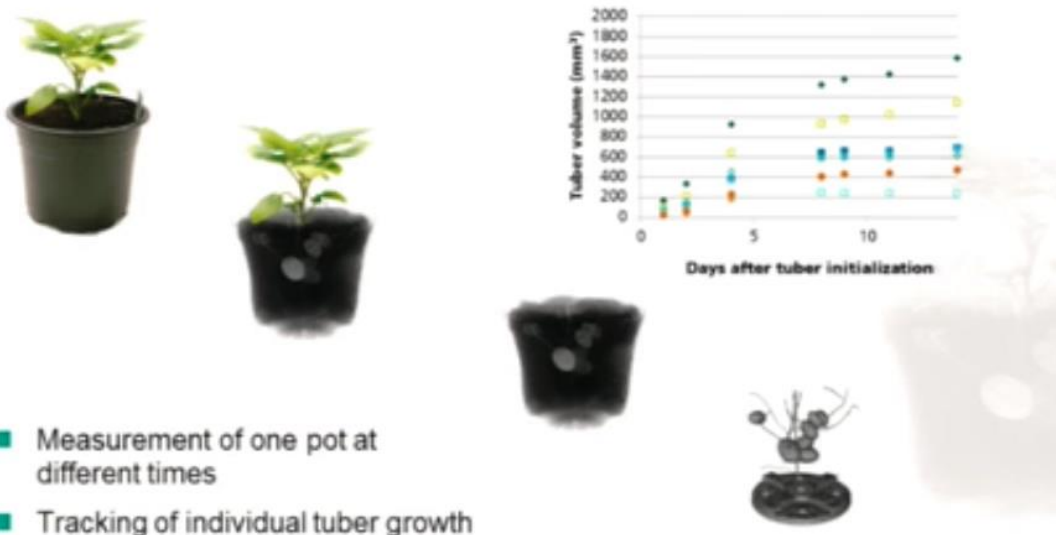

T. Wojciechowski et al. Juelich

Courtesy: IV IPPN

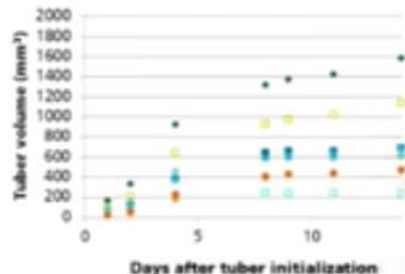

# Answering how the potato grows ? Without disturbing the soil

**Motivation**  
**Why Computed Tomography**

■ Measurement of one pot at different times  
■ Tracking of individual tuber growth

# Photosystem sensitivity: Dryland fruit crops

CHLOROPHYLL FLUORESCENCE IMAGING

## 11 orchard crops

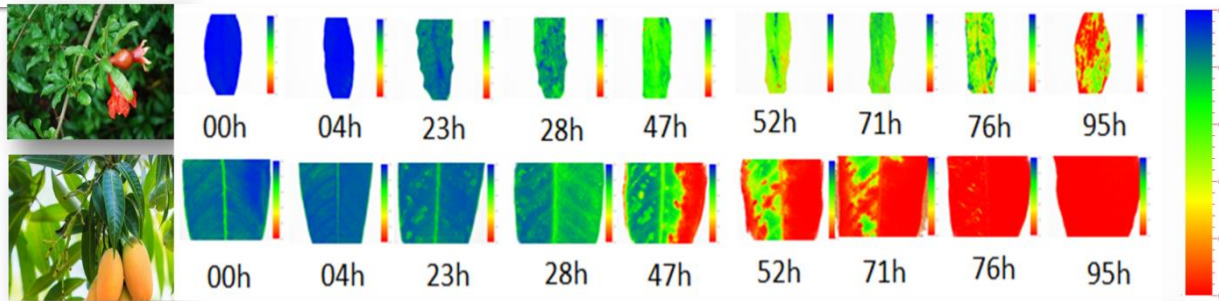

- Acid lime
- Dragon fruit
- Guava
- Karonda
- Mango
- Sapota
- Sweet orange
- Pomegranate
- Custard Apple
- Jamun
- Grape

- 5 replications of each crop

09:14:47

# Investigation on photosynthetic efficiency of Horticulture crops during desiccation

Tools and methods developed can help identify effect of bioregulators/ biostimulants on physiology of plants

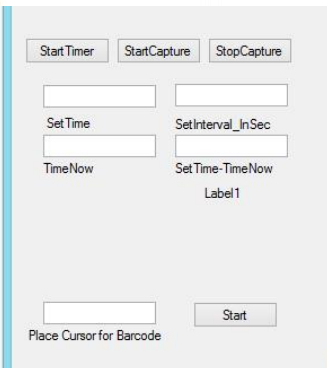

# Develop/optimize tools to scale up phenotyping capacity

## Imaging Scientific Hints About Resilience to Abiotic Stress (ISHARAS)

Image capture

Image analysis

Database and Inference

# Image based tools can expand our knowledge for crop management decision

# Future perspectives

- Can we use phenomics to identify
  - right combination of crop genotype and management practice ??
- Can bioregulators and biostimulants
  - be part of smart resource management
  - Survival of seedlings to protection of pollen grains to avoid sterility-flower droop-fruit drop
  - Improved recovery from temperature and drought stress

# Summary

- Definition of climate smart agriculture should encompass abiotic stress tolerance, in season stress management
- Available hints useful for translating power of science into product
  - Resilient crop genotypes
  - Management for resilience
- Phenomics tools are emerging for high throughput can complement effort for the best management solutions
  - Effective bioregulators and time of application for greater profit for farmers
